Use-Case Flow Specification

Problem Statement #55 – Book Club Reading Challenge & Discussion Portal

Use Case: UC-08 – Vote in Monthly Poll

Primary Actor: Club Member

Secondary Actor: Club Admin (owns/creates the poll)

Includes: UC-07 – Verify User Session (<<include>>, always executed to prevent duplicate votes)

Preconditions

- The Club Member is logged in and holds a valid, active session token.
- A monthly book-selection poll is currently open, with 2–6 nominated titles and an unexpired closing date/time.

Postconditions

- Success: exactly one vote for the member is recorded against the poll, the live tally reflects the new vote, and the member cannot vote again in this poll.
- Failure: no vote is recorded, the tally is unchanged, and the member is shown the reason their vote was not accepted.

Main Success Scenario

1. Club Member navigates to the “Monthly Poll” section of the portal.
2. System displays the list of nominated titles for the current poll along with a countdown to the closing time.
3. Club Member selects one nominated title and clicks “Cast Vote.”
4. System executes <<include>> UC-07 Verify User Session, validating the member’s session token against the session store.
5. System checks whether this member has already voted in the current poll.
6. System records the vote against the member’s ID and locks further voting by that member for this poll.
7. System updates the live vote tally and displays the updated results/percentages to the member.
8. System displays a confirmation message: “Your vote has been recorded.”
9. Use case ends successfully.

Alternate Flow

5a. Duplicate Vote Attempt

- 5a1. System detects that this member ID already has a recorded vote for the current poll.
- 5a2. System rejects the new vote and displays: “You have already voted in this poll.”
- 5a3. System leaves the existing tally unchanged.
- 5a4. Use case ends without recording a new vote (postcondition: failure).
